

PROJECT REPORT: WEBSITE TRAFFIC & PERFORMANCE ANALYSIS

1. Introduction

In today's digital era, monitoring and analyzing website performance is critical for any business or organization. This project focuses on analyzing the web traffic data of various websites (Site A to Site J). Through this analysis, we aim to evaluate user engagement, traffic distribution, and identify which sites are performing exceptionally well versus those that require immediate optimization.

2. Objectives

To compare the total Sessions and Unique Users across different websites. To analyze the Bounce Rate to understand user engagement levels. To measure the Conversion Rate (%) to evaluate the business success of each site. To build a professional and interactive Excel Dashboard for visual analysis.

3. Data Dictionary

The project utilizes the following key web analytics metrics:

Website: The name of the specific platform (Site A to Site J).

Sessions: The total number of visits recorded on the website.

Users: The number of unique individuals who visited the site.

Bounce Rate (%): The percentage of single-page visits (users leaving without taking action).

Session Duration (Min): The average time a user spends on the website during a session.

Conversion Rate (%): The percentage of users who complete a desired goal (e.g., buying a product or signing up).

4. Key Findings & Analysis

Based on the interactive Excel Dashboard created, the following insights were discovered:

Top Performing Website: Site D

leads the chart with the highest traffic, recording **1,800 sessions** and maintaining a healthy average session duration of 3.8 minutes.

Highest Conversion Efficiency:

While Site D has the most traffic, **Site C** achieves the highest **Conversion Rate at 4.1%**, followed closely by **Site G at 3.8%**. This indicates highly relevant content and a smooth user experience on these sites.

Underperforming Area: Site H

is the weakest performer across all metrics. It has the lowest traffic (**800 sessions**), the highest **Bounce Rate (55%)**, and a poor **Conversion Rate of 2.2%**. This site requires urgent redesigning and content optimization.⁵.

5 Conclusion

This project demonstrates that high traffic alone does not guarantee success. True website efficiency depends on low bounce rates and high conversion capabilities. The developed Excel Dashboard serves as a powerful management tool to monitor these web metrics seamlessly and make data-driven marketing decisions.
